

Ground floor study

Where the garage stair lands, and the floor planned around it. Metres, to scale, house frame: x along the house (the valley at the bottom), z across (north to the right).

8.00 × 7.00	x 5.70
over all; 7.40 × 6.40 clear, 47.4 m ²	where the garage flight lands: the back wall line, 2.40 to the hill wall
3.48 × 1.20	2.00
opening in both decks, from the 5th riser	headroom over the 4th tread, both flights
17.9 · 10.6 · 6.9 · 2.2	
living room with kitchen, bedroom, hall, toilet, m ²	
2.40 + 3.39	
panorama glass: the east window and the cut corner, with a 1.00 door	
3.6	
covered corner under the first floor, m ² : the yard entrance	

Plan, 1 m above the floor

The hill is at the top, the valley and the balcony at the bottom, the yard to the left (south), the neighbour's boundary 1 m off the right (north) wall. Walls 0.30, partitions 0.10.

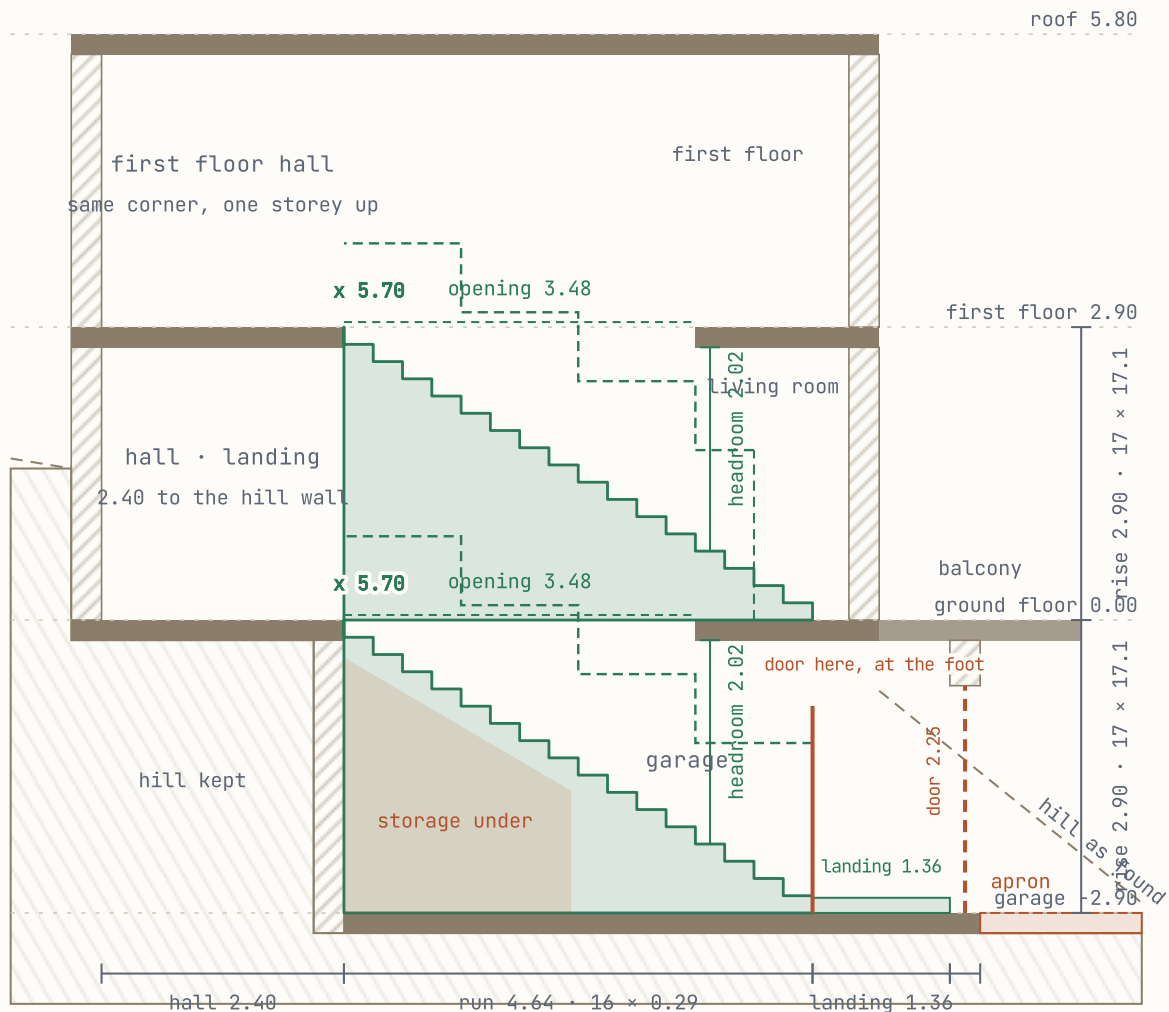

hall toilet bedroom living room with kitchen covered corner glass

- **The hall is where the stair lands.** You come up facing the hill at x 5.7, with 2.40 to the back wall; the lobby south of the landing has the toilet door on its west side and the bedroom door on its south side, and opens east into the living room. Nothing else is at the back, because the back has no light: the hill behind, the boundary beside.
- **The living room is the whole front,** a pentagon: 4.00 × 5.20 with its south-east corner cut off by a 3.39 m diagonal of glass. The east wall is a 2.40 window to the balcony from the stair foot to the glass, so the glass runs round the corner from the balcony side to the yard side.

- **The entrance from the yard** is the 1.00 door in the middle of the diagonal: the corner the cut leaves is outdoors but under the first floor, open to the yard on its south side and to the balcony on its east, a dry place in front of the door. A 0.30 column at the house corner carries the floor above.
- **The kitchen** stands against the bedroom wall, 3.20 of counter with the fridge at the hall end, and a 0.70 return under a 0.90 window to the yard. The table sits by the stair opening, the sofa faces the glass.
- **The bedroom** is 3.30×3.20 in the south-west corner with a 1.40 window to the yard: a 1.60×2.00 bed with its head to the hill wall, 0.70 past its foot to a 0.60 wardrobe. Its west wall and the toilet's are against the hill.
- **The stair up** stacks on the garage flight: same 17 risers, foot at x 10.34 in the north-east corner, top at x 5.7 again. It is entered from the side, so treads 1 and 2 stay open to the room and the balustrade starts at riser 3.

Where the garage stair lands: section along the flights, looking south

Garage floor -2.90, ground floor 0.00, first floor 2.90. One straight flight per storey, all in the same direction, through the same opening.

- **The top riser is the garage's back wall line**, x 5.7: the 17th step up lands on the ground floor over the garage's west wall, facing west into the hill side of the house with 2.40 m of floor ahead before the back wall. That is the landing, 2.40 × 1.20, in the floor's north-west corner.
- **The opening** runs from the 5th riser to the top, 3.48 × 1.20 along the north wall. The deck stays over treads 1 to 4: 1.52 × 1.20 in the north-east corner, which is exactly the foot the next flight needs. So the stair to the first floor stacks on this one, and the first floor is reached at the same spot one storey up; both decks carry the same hole.
- **Headroom is 2.00** over the 4th tread under each deck, the minimum. Starting the opening one riser earlier would give 0.17 more and leave a 1.23 foot.
- **The door between garage and house** belongs at the foot of the garage flight, on the 1.36 landing inside the garage door, swinging onto that landing; a door at the top would open onto the stair.
- **What this does to the plan:** the whole north strip from x 5.7 to the east wall is stairs, so the hall, the toilet and the bedroom door gather at the back, and the front belongs to the living room.

Rooms

ROOM	CLEAR	M ²	LIGHT AND DOORS
Living room with kitchen	4.00 × 5.20 less 2.40 × 2.40 / 2	17.9	east window 2.40, the diagonal glass 3.39 with the yard door, kitchen window 0.90; open to the hall
Bedroom	3.30 × 3.20	10.6	window 1.40 to the yard; door 0.90 from the lobby
Hall: landing and lobby	2.40 × 1.20 + 2.10 × 1.90	6.9	the garage flight lands in it; borrows light from the living room
Toilet	1.20 × 1.80	2.2	door 0.80 from the lobby; no window, mechanical vent
Covered corner (outdoors)	2.70 × 2.70 / 2	3.6	open to the yard and the balcony; the yard door
Stair opening	3.48 × 1.20	4.2	the garage flight below, the flight up above
Stair foot, on the deck	1.52 × 1.20	1.8	treads 1 to 4 of the flight up
Partitions and the glass band		1.7	
Inside the outer walls	7.40 × 6.40	47.4	of which 2.2 is the covered corner, outdoors

Still open

- The first floor: its flight lands at x 5.7 heading west, the same spot as below, so its hall is in the same corner. Its plan is next.
- The yard door: drawn in the glass, under cover. A plain door in the south wall instead would have to take the kitchen window's place.
- The balcony's rail where it meets the covered corner: open, a gate, or a step.
- The door at the foot of the garage flight: self-closing, fire-rated where the rules ask.
- A north window: the wall is 1 m from the boundary; the rules decide.
- The west wall stands against the hill (about +1.5 there), so the bedroom's and the toilet's back walls are retaining walls and need tanking.

- Whether the outer walls sit inside the 8×7 (drawn) or outside it: outside would give 8.00×7.00 clear and push the east wall onto the balcony's first 0.30.
